

RHRP Ear Exam

During Your Test

How is the test conducted?

- You will wear headphones and tones will be presented at various frequencies at different volumes
- You will respond by pressing a button when you hear the tone.

What does the process test for?

- The air conduction test examines overall hearing sensitivity.
- It determines the softest sound you can hear at different pitches (frequencies) from 500 Hz through 6000 Hz.
- The results show whether you have:
 - Normal hearing
 - Mild hearing loss
 - Moderate hearing loss
 - Severe hearing loss

How long does the hearing test take?

- An air conduction hearing test usually takes between 10 to 20 minutes
